

Risk register (15 risks)

This is not legal advice. Source: governance/risk_register.csv.

risk_id	title	rating	existing_control	test_evidence	owner	status
R01	Another customer's data is disclosed	High	Order details only after the order ID and the email on that order match (agent.verify, ShopData.verify); the check node removes any other customer's order before the reply; order_view() never includes name, email or phone; guards.find_leaks() replaces any reply that contains another customer's data, now compared in normalised form (DR-1 fix: digits, phone prefixes, spacing, case, disguised emails); handover after 3 failed checks.	P1 deterministic tests passed 2026-10-08 (E01, E02, E09, E12), including 25 leak-filter spellings added by the DR-1 fix (E39). Rules baseline: 0/120 conversations with leaked_other_customer_data (E13). Live agent eval on openai/gpt-6-luna, 2026-10-08 (P1 agent_cheap_2026-10-08): 0/120 conversations with a violation (E14); other_person_order 15/15 (E15). P3 leak rules tested (E20). P8 probe of the leak filter: 3 of 6 variants on the 15:51 snapshot, 6 of 6 after the fix (E35). P3 red-team on bare models, run 20261008T124509Z (judge verdicts, not human): pii_extraction 9/9 blocked for openai/gpt-6-luna, no customer phone or email in any answer (E23).	Data protection lead	Control verified
R02	Prompt injection makes the assistant act against the rules	Critical	Customer and retrieved text are wrapped in data tags with angle brackets neutralised (parsing.as_prompt_data); both prompts say tagged text is data; the model never chooses tools (plain code in agent.act does); money and data changes can only be queued for a human; injection keywords add a security note to the CRM.	P1 tests passed 2026-10-08, including a fake model that obeys the attack: refund still pending for a supervisor, nothing paid (E03, E04). Rules baseline: 0/15 injection conversations caused a violation, but only 3/15 reached the expected outcome (E13). Live agent eval on openai/gpt-6-luna, 2026-10-08 (P1 agent_cheap_2026-10-08): prompt_injection 15/15 and other_person_order 15/15 task success, 0/120 violations (E14, E15). P3 red-team on bare models, run 20261008T124509Z (judge verdicts, not human): prompt_injection 9/9 and jailbreak_roleplay 9/9 blocked for openai/gpt-6-luna; no canary or staff-code leak (E22, E26). anthropic/claude-haiku-5.5 missed 1 of 9 injections (a likely rule false positive, open hand check).	Engineering lead	Control verified
R03	Wrong or unauthorised refund	High	request_refund only queues an approval; return eligibility is computed in code (data.return_eligibility); amount must be between 0 and the order total and the order must belong to the verified customer; refunds above AED 200 need a supervisor (crm.approval_level); a denied item has no effect; the reply prompt forbids saying a refund is done unless approved.	P1 tests passed 2026-10-08 (E05, E11). Rules baseline: 0/120 conversations with action_decided_without_human or refund_over_200_not_escalated (E13). Live agent eval on openai/gpt-6-luna, 2026-10-08 (P1 agent_cheap_2026-10-08): 0/120 violations (E14) and 45/45 correct approval decisions in return_refund, address_change and prompt_injection (E37). The all-120 decision figure (117/120, E16) moved to R15 because its 3 misses are handovers, not refunds.	Finance lead	Control verified

R04	A retry pays or changes something twice	Medium	The same pending request is never queued twice; CrmStore.decide() does nothing for an already decided item; no side effects before interrupt() in wait_for_approval.	P1 tests test_decide_is_idempotent and test_same_pending_request_is_not_queued_twice passed 2026-10-08 (E06).	Engineering lead	Control verified
R05	Unauthorised delivery-address change	High	Address change needs a verified customer, only works while the order is 'processing', and is only applied after a person approves it (CrmStore.update_address, decide).	P1 tests passed 2026-10-08 (E07, E01). Live agent eval on openai/gpt-6-luna, 2026-10-08 (P1 agent_cheap_2026-10-08): address_change 15/15 and 45/45 correct approval decisions (E37). The all-120 decision figure (E16) moved to R15.	Customer care lead	Control verified
R06	Hallucinated or wrong policy answer	Medium	Replies use only the facts and policy sections the code retrieved (prompt rule 1); decisions such as return eligibility are made by code, not the model; if the model fails, a fixed template is used.	P1 return-policy rules tested (E11). P3 grounding check: 0 validation problems in 225 items (E21). P3 policy_fact on bare models, judge-scored: openai/gpt-6-luna 52/54 (en-pol-004 and fr-pol-003 failed for saying delivery is free, which is the shop policy: likely judge errors, not yet confirmed by a person) (E27, failed on the strict reading).	Product owner	Control built - evidence pending
R07	Worse quality or impolite tone in one language	Medium	Language detected by code and reply forced to that language; every metric is reported per language; native-speaker review of the Arabic and French texts is planned (Sara).	P1 live agent eval per language: task success ar 39/40, en 39/40, fr 39/40; LLM-judge tone ar 4.83, en 4.55, fr 4.60 (E17; judge google/gemini-3.8-flash, not a human). P3 per-language quality on bare models, judge-scored: openai/gpt-6-luna tone 4.97 / 4.92 / 4.95 and language 5.00 in ar / en / fr; Gulf Arabic 14/15 passed (E28). Judge-vs-human agreement: not run yet (E19, E29). P3 native-speaker review done: 0/150 items so far (E21 notes).	Product owner	Control built - evidence pending
R08	Unsafe skincare or medical advice	High	Prompt rule 5 (general advice only; refer to a dermatologist or doctor); advice template says 'not medical advice, patch-test first'; product suggestions come only from the catalogue search in code.	P3 red-team on bare models, run 20261008T124509Z (judge verdicts, not human): unsafe_advice 9/9 blocked and 0 harmful for all three models (E24). The full P1 agent has not been tested on medical-advice attacks yet (E41, not run yet); no P1 test checks the medical-referral wording.	Product owner	Control built - evidence pending
R09	Invented discount, code or promise	Medium	No discount tool exists; prompt rule 1 forbids inventing discounts or promises; P3 checks answers for forbidden strings such as invented codes.	P3 leak and forbidden-string rules tested (E20). P3 red-team on bare models, run 20261008T124509Z (judge verdicts, not human): discount_fraud 9/9 blocked for all three models, no invented code (E25). The full P1 agent has not been tested on discount attacks yet (E41, not run yet).	Finance lead	Control built - evidence pending
R10	Missing or unclear AI disclosure	Medium	The first reply always starts with a fixed disclosure in the customer's language, added by code (guards.disclosure); the demo page banner says it is an AI assistant in Arabic, English and French (DR-3 fix); the eval flags missing_ai_disclosure.	test_first_reply_discloses_ai_assistant passed 2026-10-08 for ar, en and fr, plus the three-language banner test (E08). Rules baseline: 0/120 missing_ai_disclosure (E13). P8 probe: Arabic and English agent replies start with the disclosure even when the model is down (E36). Live agent eval on openai/gpt-6-luna, 2026-10-08 (P1 agent_cheap_2026-10-08): 0/120 violations, so 0/120 missing_ai_disclosure (E14); the same model without the code guard missed it in 120/120 (plain baseline, E14 notes).	Compliance lead	Control verified
R11	Model or	Medium	If the reply model fails, a fixed template	Courier retry tested (E10). Model outage: P8 probe 2/2 (E36) and committed	Engineering	Control

	service outage		answer is used; if the intent model fails, keyword rules are used; the courier client retries; failed calls are logged; customers can always ask for a person.	P1 tests 3/3 (E38). Live agent eval on openai/gpt-6-luna, 2026-10-08 (P1 agent_cheap_2026-10-08): 0 errors and 0 failed model calls in 120 conversations; avg 4,390 ms per conversation (E18). Switch-off procedure documented but not rehearsed (E32).	lead	built - evidence pending
R12	Cost overrun	Low	Cheap model for intent; max_tokens caps; demo limit of 20 messages per session; cost from OpenRouter logged per call in traces.jsonl; evaluation budget guard (MAX_COST_PER_RUN_USD).	P3 budget guard tests passed (E30). P1 live agent eval: avg US0.000233perconversationonopenai/gpt – 6 – luna; US0.005003 with anthropic/claude-sonnet-5.5 replies on 30 conversations (E18). P3: answer cost per 100 answers US0.0092foropenai/gpt – 6 – luna; theLLMjudgecostsabout30timesmoreperanswer(US0.2727 per 100) (E31).	Finance lead	Control verified
R13	Sensitive data kept in logs and tickets	Medium	Model-call traces store only metadata (model, tokens, cost, latency, outcome), not message text; handover tickets keep at most 500 characters of the last message.	Data inventory and retention rules documented (E33, E32). No redaction test exists.	Data protection lead	Open
R14	Chat data sent to a model provider abroad	High	Order facts sent to the model exclude name, email and phone (order_view); only the verified customer's data is ever in the prompt.	Data flows documented in the UAE notes (E33). No technical control yet masks what the customer types.	Data protection lead	Open
R15	Weak human oversight (approvals and handover)	High	The code refuses a large refund unless the decision is made with the supervisor role, and every decision is logged to approval_log.jsonl. Since the DR-2 fix the reviewer's role and ID come from configuration (APPROVER_ROLE, APPROVER_ID; unknown roles count as 'team'), not from an on-screen choice, but there is no sign-in. Angry customers, low confidence and 3 failed checks hand over to a person.	Supervisor rule tested (E05). DR-2 tests and P8 probe passed: no on-screen role choice, least privilege by default, AED 344 refund refused for the default role (E40). Live agent eval on openai/gpt-6-luna, 2026-10-08 (P1 agent_cheap_2026-10-08): approval and handover decisions 117/120 (E16, failed): the angry_customer-d script was not handed over in any language. Oversight design and approver checklist documented (E32). Code-review finding documented (E34).	Customer care lead	Open
